

Water Energy Nexus – Towards Zero Pollution and GHG Emissions

Vladimir Novotny

Northeastern University Boston

Key note presentation SWIF November 2009

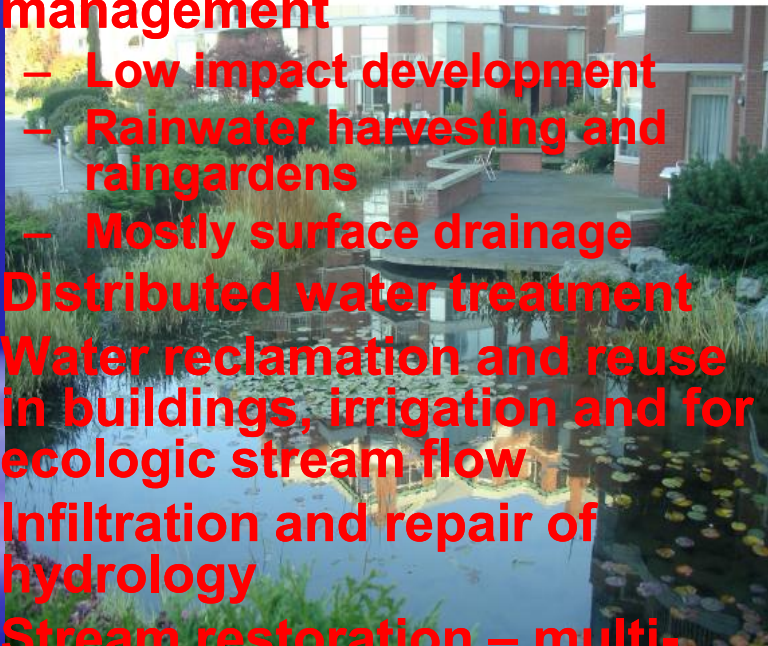

New Urban Water Sustainability Paradigm is Needed Water Centric Ecocity

VISION: Achieve sustainable integrated urban water, energy reclamation, drainage and transportation infrastructures connected to receiving waters that will be resilient to natural and anthropogenic stresses, including extreme events, implement water conservation, provide good quality of reclaimed water for diverse uses and reduce carbon emissions when compared to the current situation.

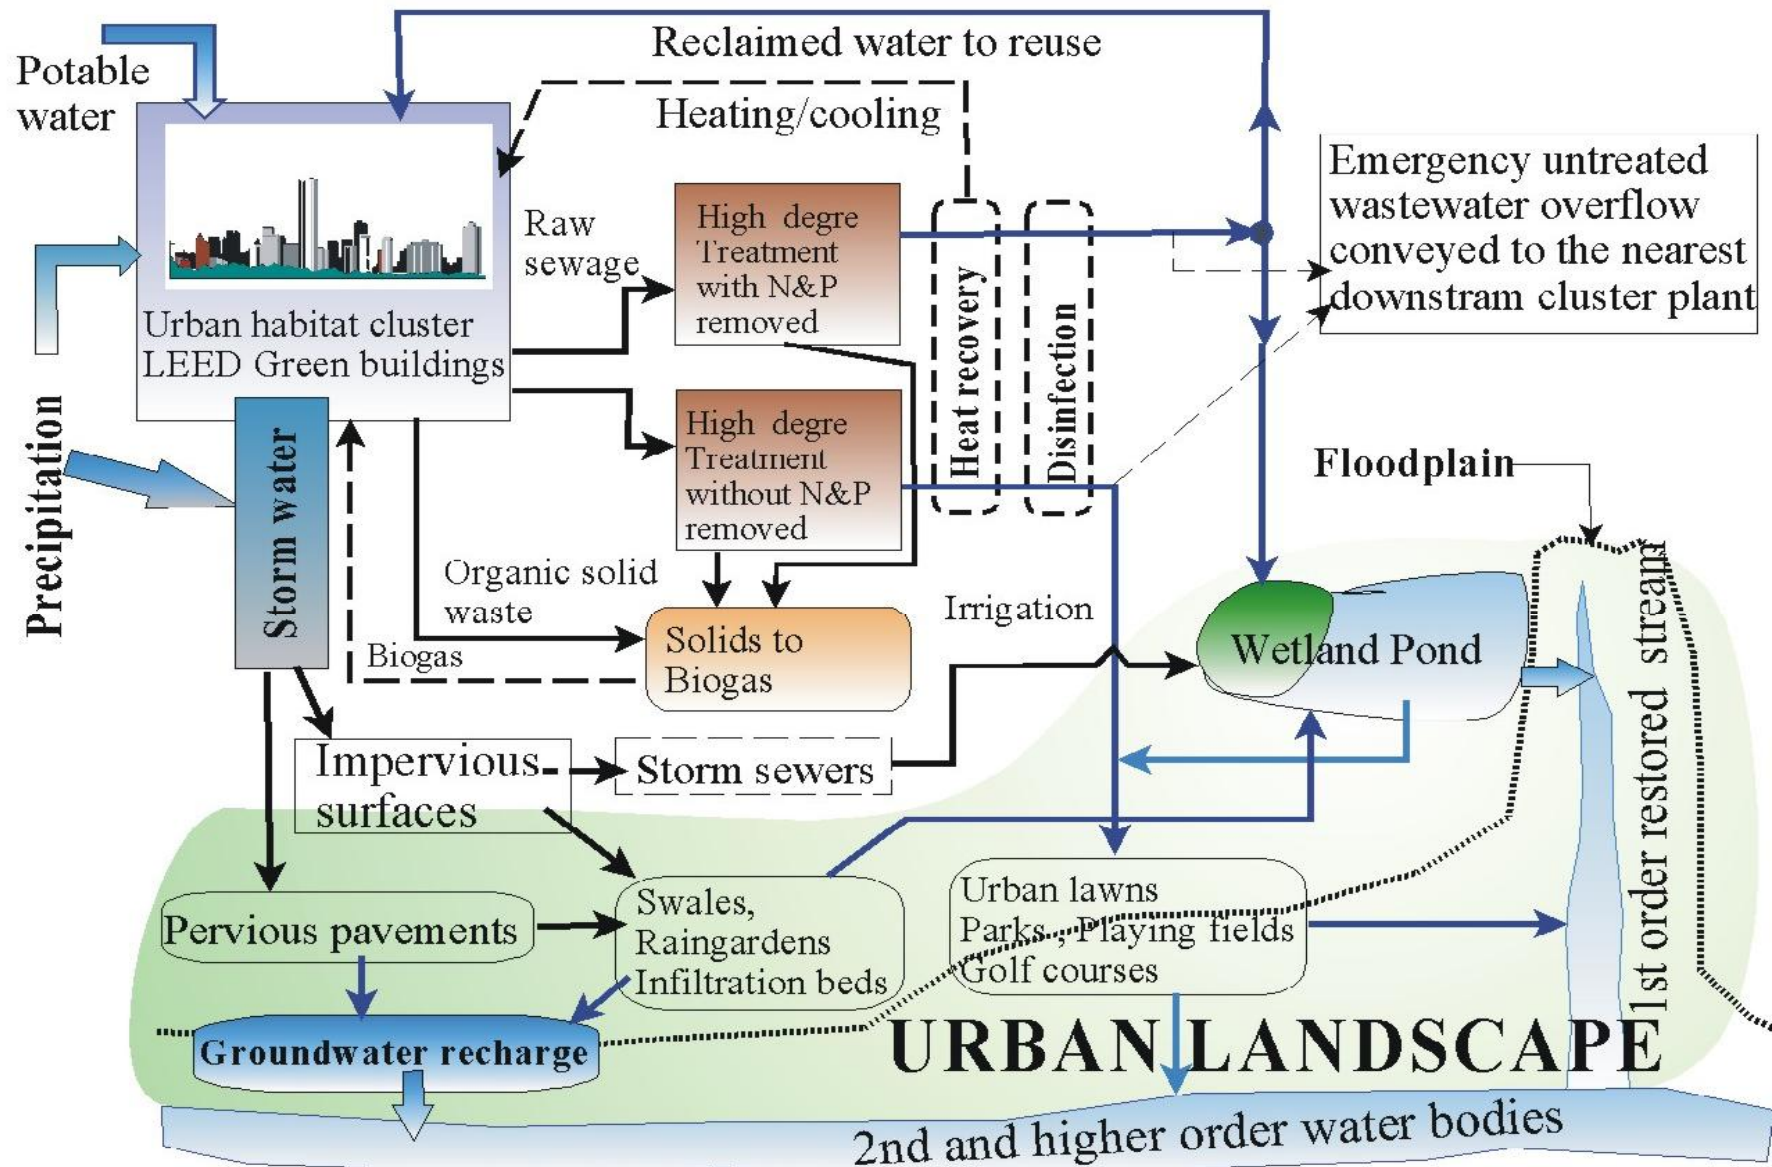

Urban (green) infrastructure, resilient and hydrologically and ecologically functioning landscape and water resources will constitute one system

Vision of Future Water Centric Ecocity

- **Water conservation**
- **Distributed stormwater management**
 - Low impact development
 - Rainwater harvesting and raingardens
 - Mostly surface drainage
- **Distributed water treatment**
- **Water reclamation and reuse in buildings, irrigation and for ecologic stream flow**
- **Infiltration and repair of hydrology**
- **Stream restoration – multi-functional water bodies are a life line of the ecocity**
- **Heat and energy recovery**
- **Organic solids management for energy recovery**
- **Source separation**
- **Also**
- **Water recovery**
- **Renewable energy source (solar, wind, hydropower)**
- **Sustainable low carbon traffic emissions**
 - Accessible public transportation
 - Hybrids and plug-ins
- **Recreation, walking, biking**
- **Suburban organic agriculture**

DECENTRALIZED CLUSTER WATER MANAGEMENT

Cluster (EcoBlock) based decentralized management

- A cluster (Ecoblock) is a semiautonomous part of the city that, for most part, which has its own water/stormwater/wastewater management
 - Cluster may range in size from a high rise building to a subdivision or a section of the city with several thousands inhabitants
 - Cluster infrastructure
 - Distributes water and practices water conservation and reuse
 - Implements energy saving in buildings (e.g., green roofs, solar energy)
 - Provides stormwater conveyance (mostly surface), storage and infiltration (groundwater recharge) and nature mimicking BMPs
 - Water reclamation units (high efficiency WWT)
 - Energy recovery from wastewater
 - Biogas recovery
 - Ecologically and hydrologically functioning landscape
 - Clusters are interconnected to provide resiliency against failure

One Planet Living (WWF)

- zero carbon emissions with 100% of the energy coming from renewable resources;
- zero solid waste with the diversion of 99% of the solid waste from landfills;
- sustainable transportation with zero carbon emission from transportation inside of the city;
- local and sustainable materials used throughout the construction;
- sustainable foods with retail outlets providing organic and or fair trade products;
- sustainable water with a 50% reduction in water use from the national average;
- natural habitat and wildlife protection and preservation;
- preservation of local culture and heritage with architecture to integrate local values;
- equity and fair trade with wages and working conditions following the international labor standards; and
- health and happiness with facilities and events for every demographic group.

Seven Cities Ecocities Review

Hammarby Sjöstad

Dongtan

Qingdao

Tianjin

Masdar

Treasure Island

Sonoma Valley

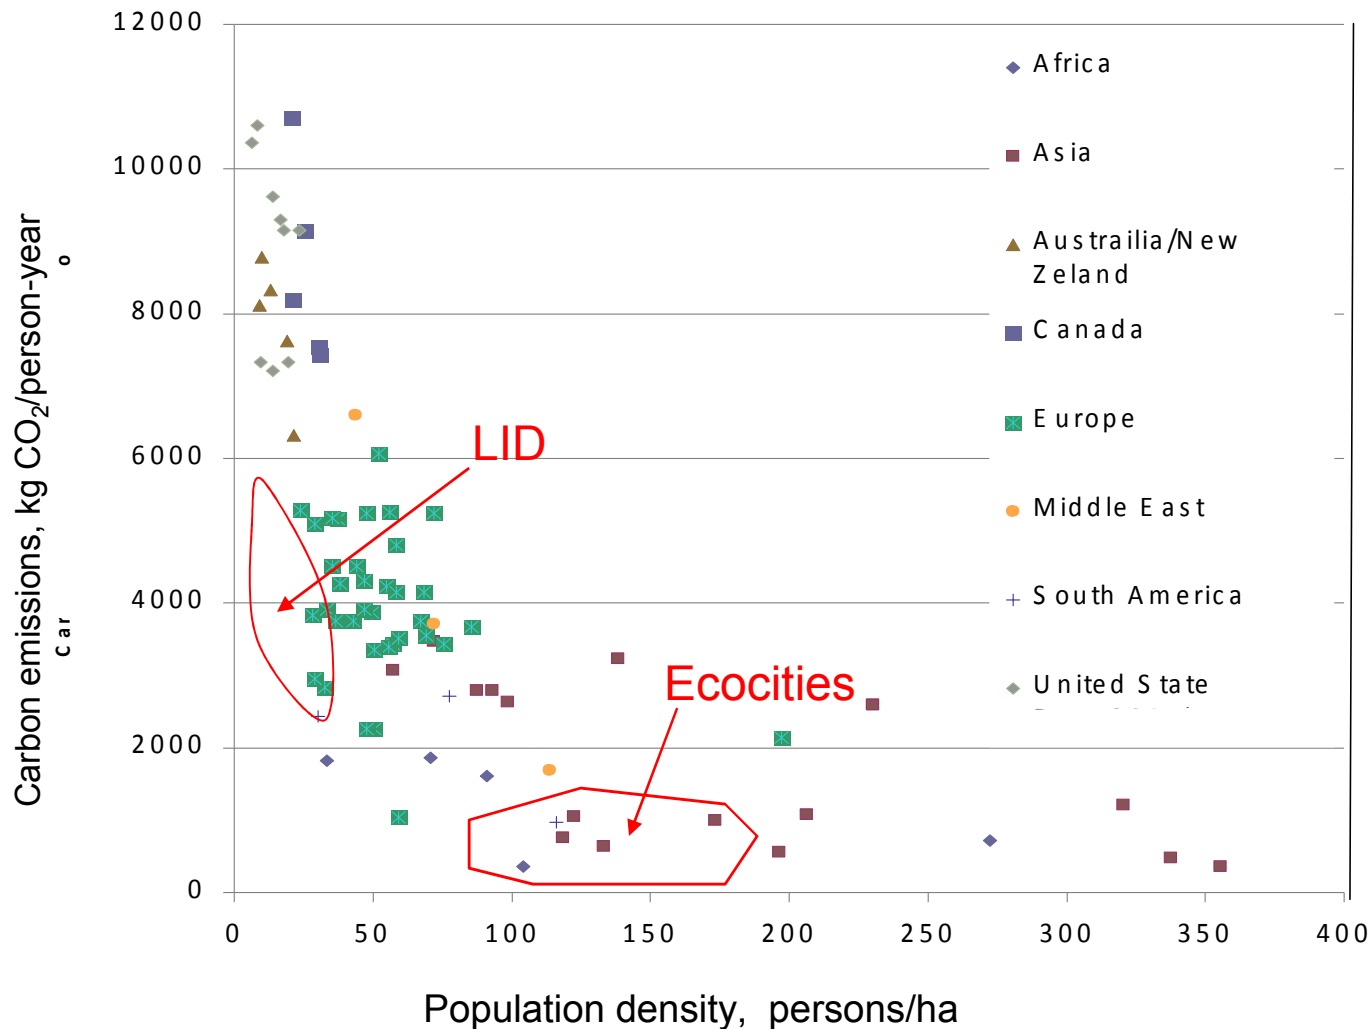

| City | Population Total | Population Density #/ha | Water use L/cap-day | % water recycle | Water System | % Energy savings renewable | Green area m ² /cap | Cost US\$/unit* |
|---------------------|-----------------------------------|-------------------------------|------------------------|--------------------|---------------------|----------------------------------|-----------------------------------|--------------------|
| Hammarby Sjöstad | 30,000 | 133 | 100 | 0 | Linear | 50 | 40 | 200,000 |
| Dongtan | 500,000 (80,000) ⁺⁺ | 160 | 200 | 43 | Linear | 100 | 100 | ~40,000 |
| Qingdao | 1500 ⁺ | 430 - 515 | 160 | 85 | Closed loop | 100 | ~15 | ? |
| Tianjin | 350,000 (50,000) ⁺⁺ | 117 | 160 | 60 | Partially closed | 15 | 15 | 60,000 – 70,000 |
| Masdar | 50,000 | 135 | 160 | 80 | Closed loop | 100 | <10 | 1 million |
| Treasure Island | 13,500 | 170 | 264 | 25 | Mostly Linear | 60 | 75 | 550,000 |
| Sonoma Valley | 5,000 | 62 | 185 | 22 | Linear | 100 | 20 | 525,000 |

Population density matters

Difficult to compare US cities with Asian Cities or countries with different economic levels

Based on various sources

Net zero carbon footprint

- National Science and technology Council (US)
 - 60 – 70 % reduction by efficient appliances, automobiles, water and used water disposal and reuse
 - In US up to 7 % of energy is for water delivery and management
 - In California 20 % of electricity and 37% of natural gas use is for water and used water
- 30% from renewable sources

Is it realistic?

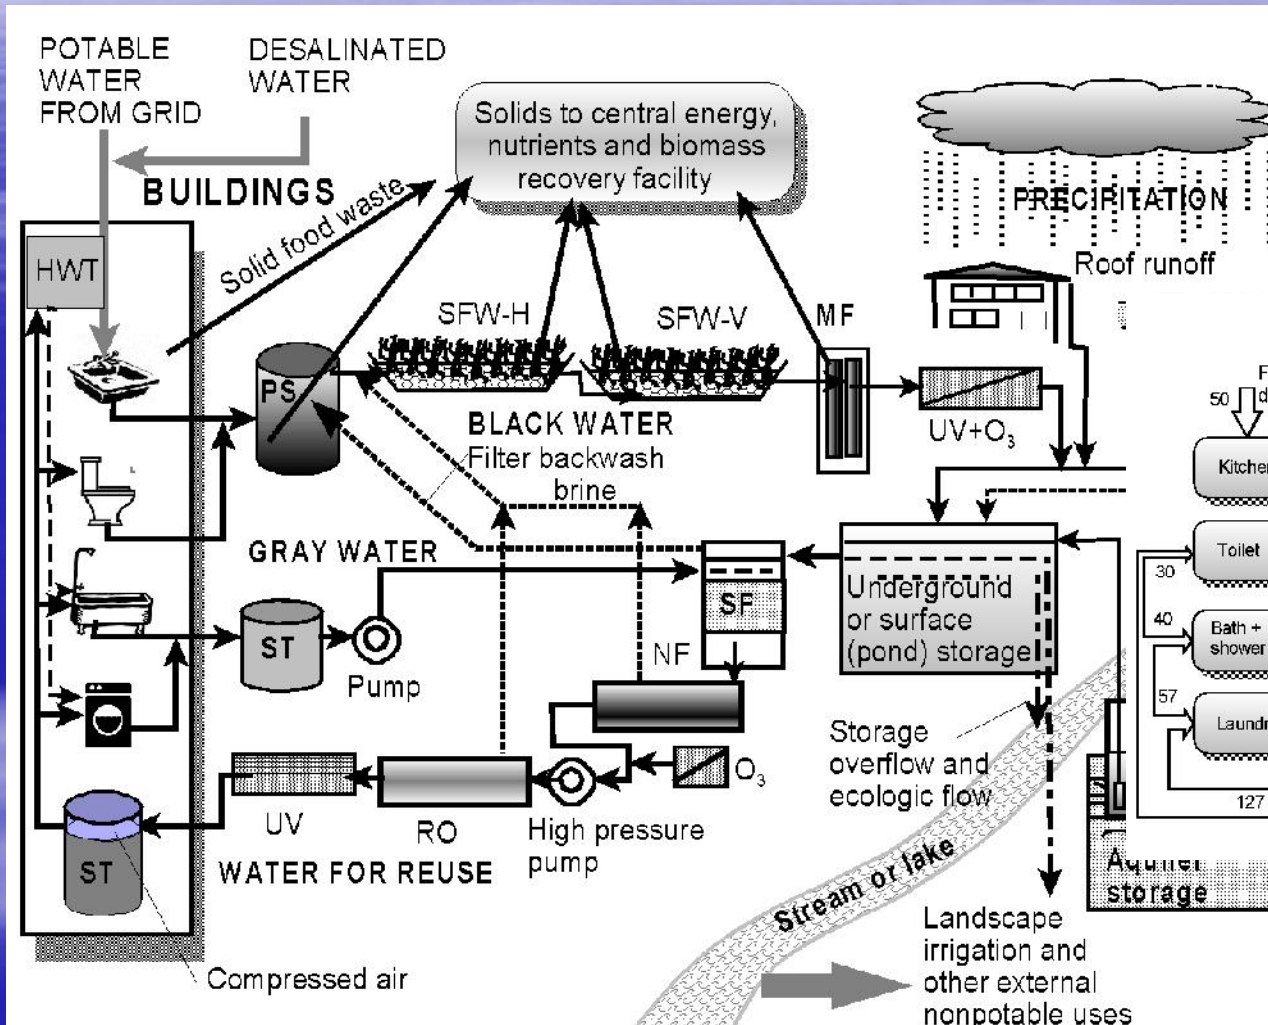

Water conservation – linear system

| Water use | Without water conservation* | | With water conservation | |
|----------------------------|-----------------------------|---------|-------------------------|---------|
| | Liter/cap-day | Percent | Liter/cap-day | Percent |
| Faucets | 35 | 14.7 | 35 | 25.8 |
| Drinking water and cooling | 3.6 | 1.2 | 2.0 | 1.5 |
| Showers | 42 | 17.8 | 21 | 15.4 |
| Bath and Hot Tubs | 6.8 | 2.0 | 6.0 | 4.4 |
| Laundry | 54 | 22.6 | 40 | 29.4 |
| Dish washers | 3.0 | 1.4 | 3.0 | 2.2 |
| Toilets | 63 | 26.4 | 14 | 10.3 |
| Leaks | 30 | 12.6 | 15 | 11.0 |
| Total Indoor | 238 | 100 | 136 | 100 |
| Outdoor | 313 | 132 | 60** | 44 |
| Total | 551 | 232 | 196 | 144 |

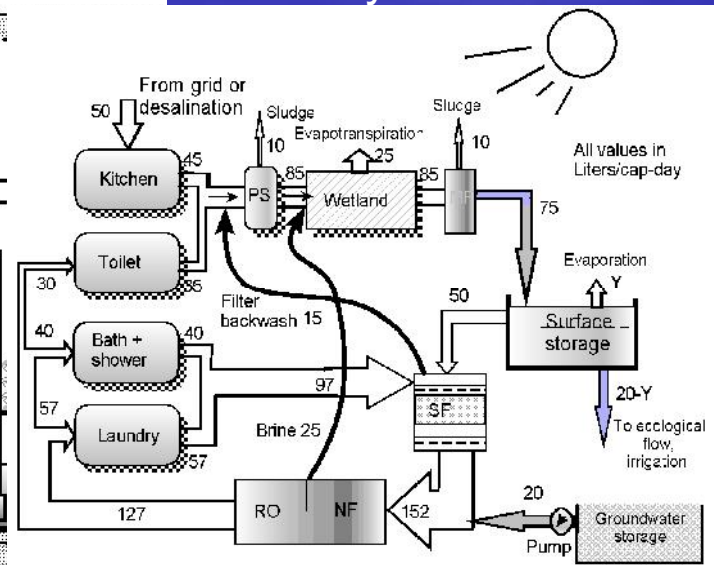

** Reflects converting from lawn to xeriscape using native plants and ground covers with no irrigation. Water use is for swimming pools, watering flowers and vegetable gardens

Closed cycle distributed system

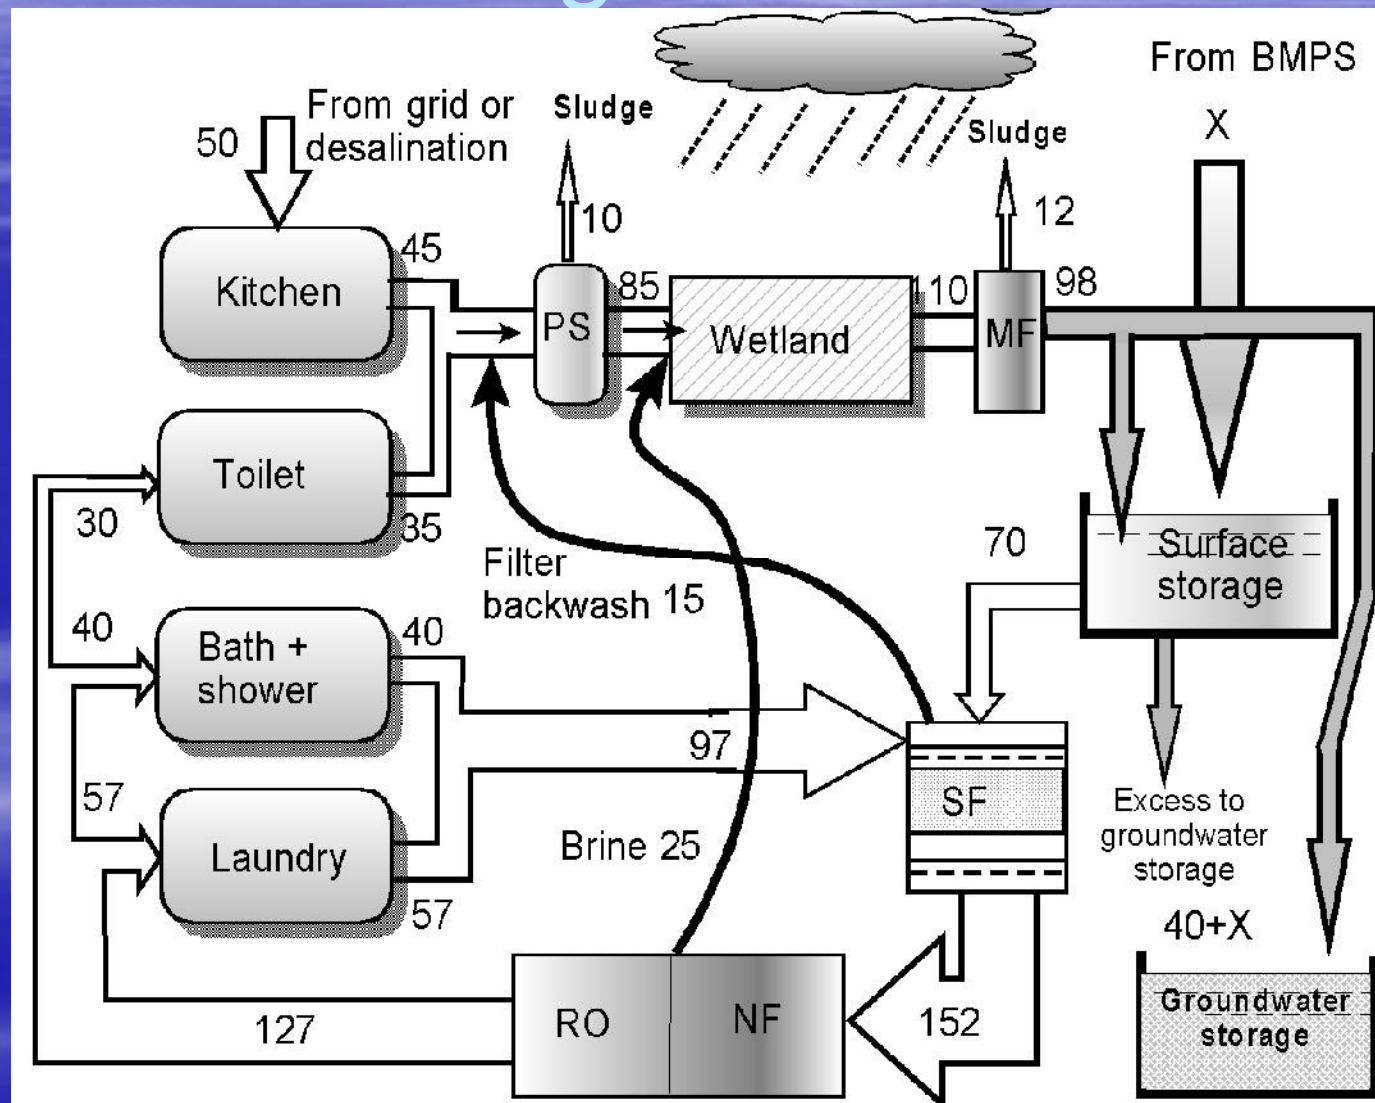

The number of cycles without make up water is very limited.

Make up water comes mainly from treated (and stored) storm water

PS –Solids separation, SFW –submerged wetland, MF membrane filter, SF sand filter, NF Nanofilter, RO – reverse osmosis, ST-storage, HWT – hot water tank

Treated surface runoff and rain harvesting is needed

Energy savings by reducing water demand

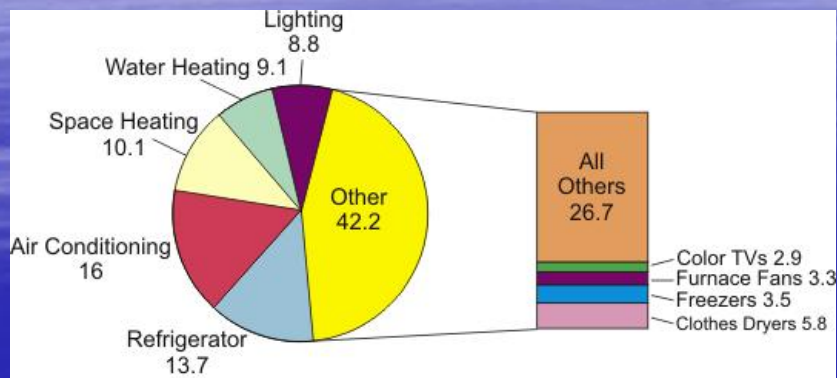

- In US 1 kW-hour represents 0.61 kg of CO₂ emitted
- Examples of energy use
 - Activated sludge process with nitrification 0.72 kW-hr/ m³ (0.44 kg CO₂ emitted per m³)
 - Reverse osmosis in reuse and desalination 5 - 15 kW-hr/ m³ (3-9 kg CO₂ per m³)
 - National average energy cost of providing water and treatment from the grid 2.26 kW-hr/ m³ (1.4 kg CO₂ emitted)

Reuse with high efficiency solid and pollutant removals (e.g. microfiltration and reverse osmosis) and desalination (e.g. in Singapore and in California, e.g. Orange County in US) require a lot of energy

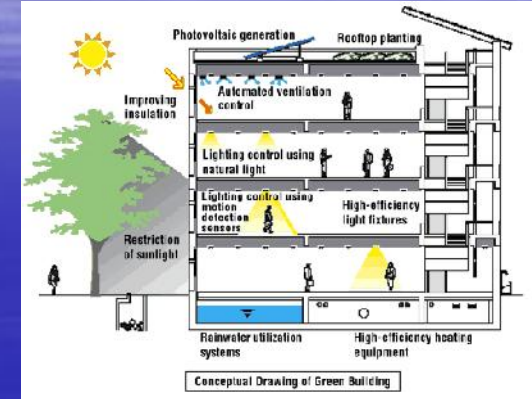

Water conservation is the best alternative

Domestic energy makes and savers

Source: Energy Information Administration, Form EIA-457A, B, C, E, and H of the 2001 Residential Energy Consumption Survey.

Passive energy savings

Tankless water heaters

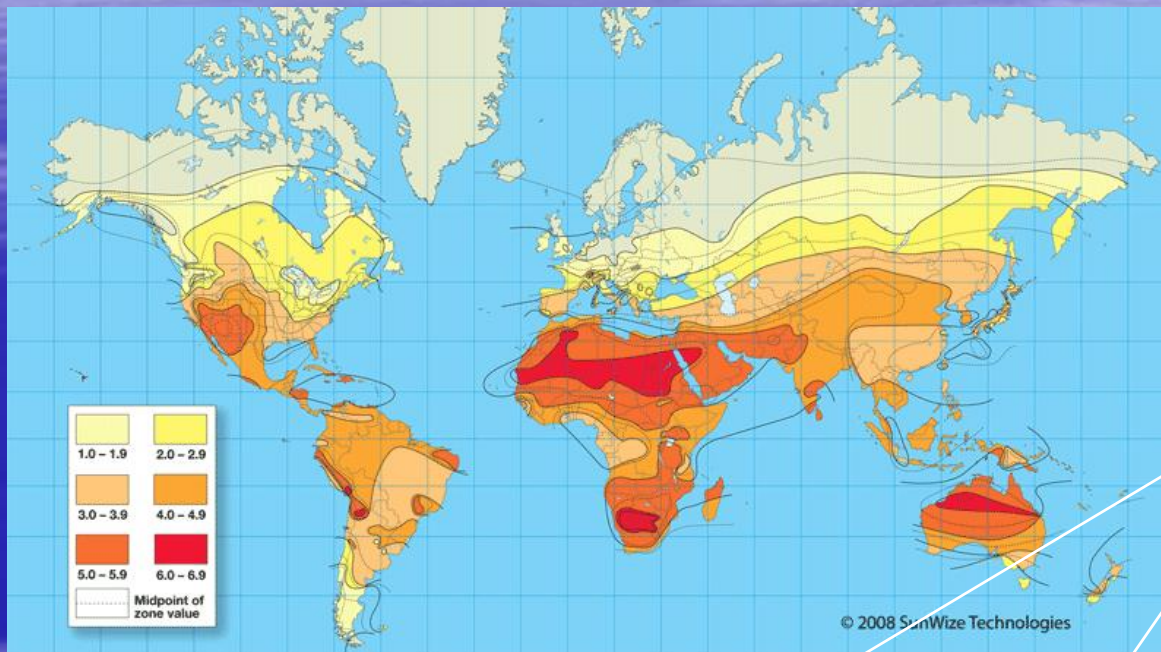

Heat pump

- * Air to air
- Water to air
- Water to water
- Ground to water

Heat Pump Water Heater

Solar energy

Concentrated heat

Photovoltaics

Wind energy

- Individual homes kWatts
- Distributed
- Winfarm GWatts

Energy from water used water

- Heat recovered by heat pumps
- Biogas from anaerobic processes
 - Digester
 - Upflow anaerobic sludge blanket reactor
- Hydrogen fuel cell
- Microbial fuel cell

| Types of gas | Biogas 1 Household waste | Biogas 2 Agrifood industry | Natural gas |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Composition | 60% CH ₄ 33 % CO ₂ 1% N ₂ 0% O ₂ 6% H ₂ O | 68% CH ₄ 26 % CO ₂ 1% N ₂ 0% O ₂ 5 % H ₂ O | 97.0% CH ₄ 2.2% CO ₂ 0.4% N ₂ 0.4 % other |
| Energy content kWh/m ³ | 6.1 | 7.5 | 11.3 |

Examples of new technologies

UASB Reactor

- 0.4 L CH₄/g COD removed
- 9.2 kW-hr/m³ of methane

Hydrogen fuel cell with biogas reforming

- Converts methane into hydrogen
- Greater efficiency than methane combustion

Microbial fuel cell (Logan 2008)

- Convert organic biomass directly into electricity or hydrogen

The diagram illustrates a wastewater treatment plant (WWTP) integrated with renewable energy and resource recovery. The process begins with **Biomass** entering a **Pre-digester**, which produces **Concentrated used water or liquid sludge**. This sludge is then fed into an **Anaerobic Upflow Reactor**, which is powered by **Concentrated Solar Panels** and **Heat** from **Biogas reforming**. The reactor produces **Biogas** and **Supernatant**. The **Biogas** is sent to a **SMR** (Sulphur Monoxide Reforming) unit, which also receives **Desulphurization** input. The SMR produces **H₂** (hydrogen) and **CO₂ to sequestering**. The **H₂** is used in an **H₂ Fuel cell**, which also receives **O₂ (air) in** and produces **Water**. The **CO₂ to sequestering** is used for **pH adjustment** and **Heat**. The **Supernatant** is sent to a **Belt filter**, which produces **Solids to soil** and **Reject**. The **Reject** is sent to an **Anaerobic upflow reactor**, which produces **Struvite** and **Concentrate**. The **Concentrate** is sent to a **Membrane filter**, which produces **UV disinfection** and **Effluent to disposal or reuse**. The **Effluent to disposal or reuse** is also connected to a **Smart Electric Grid**.

When treating
concentrate used
water it can
produce = 0.8 kW-
hrs/cap-day of
clean energy

More energy can be produced jointly from digested solids (vegetation, refuse, shredded wood)

20 – 25 years ahead outlook

Per capita CH₂ emissions in 100 US cities

| Energy use for | CO ₂ emissions in tons/cap-year | % of total |
|----------------------------------------------|--------------------------------------------|------------|
| Transportation by cars | 4.091 | 47.0 |
| Public transportation | 0.388 | 4.4 |
| Home heating by gas or oil | 1.470 | 17.0 |
| House electricity including that for cooling | 2,751 | 31.6 |
| Total | 8.71 | 100 |

Source Gleaser and Kahn (2008)

It appears that the US increasing trend of carbon emissions has been reversed in 2007 (Brown, 2009)

- Higher appliance energy standards
- Stricter automobile emissions standard
- Virtual phasing out of coal power plants
- Very large increase of renewable energy production, etc.

Conservative assumptions for the future

- Carbon foot print of the electric energy production will be reduced from 0.62 kg CO₂/kW-hr today to 0.35 kg CO₂/kW-hr by 2030 – 2035
- Vehicular traffic- majority of cars will be hybrid and plug-ins, expected GHG emissions reduced by 60%. Minimum traffic is anticipated in ecocities
- Public transportation by electric trains, light rail and buses will increase but the carbon footprint will decrease
- Heating by passive energy savings, insulation and using heat pumps will reduce heating carbon footprint
- Electricity us by households is expected to decrease by 60 – 70 % (National Science and Technology Council)

These measures could reduce carbon footprint from 8.7 tons of CO₂/cap-year to 3 tons CO₂/cap-year (slightly less than Barcelona today)

Water/used water contribution

- Reducing water use from 0.5 m³/person-day to 0.2 m³/person-day will reduce carbon footprint by 0.2 tons/cap/-year
- Extracting heat from used water and producing electricity from UASB biogas by fuel cell 0.47 tons/cap/-year
- Miscellaneous (reduction of pumping cost by bringing stormwater drainage to surface, etc.) 0.3 tons/cap/-year
- Biogas combustion or burning vegetation residues, and combustible refuse in incinerators is carbon neutral

Total new water/stormwater/used water
management carbon footprint reduction

1 ton/cap-year

Looking for 2 more t CO₂/cap-year

- More reduction by private automobiles
 - Higher density settlements with short distance to public transportation, walking, biking
-1.1 ton CO₂ /cap-year
- Photovoltaics on the roof of each house -
1.1 tons CO₂/cap-year
- Small horizontal wind turbines in each block
 - up to 1.5 CO₂/cap-year

It is realistic and doable

Conclusions

- US has one of the highest per capita footprint
 - Low density urban centers
 - High automobile use
 - Great reliance on fossil fuel (primarily coal) power production
- Adopting and adapting the ecocity guidelines is Increasing significantly production from renewable carbon free sources
 - Water conservation is effective
 - Biogas conversion to electricity or hydrogen with carbon sequestering is effective
 - Wind turbines on each block
 - Large inclusion of solar power
 - Limiting automobile use, hybrids and electric pug-ins are very effective
 - Heat recovery from used water
 - More efficient appliances and heating (e.g., feat pumps)
- The goal of net zero carbon footprint is achievable by 2030 even in the US
